

Do you operate in the field of **nanotechnology** and want to check whether your safety, risk management and prevention measures are adequate?

We conduct a risk screening of your activities, focusing on the manufacturing and use of nanomaterials. Within 2 ½ days you will know whether and where there is a need for action and how to manage those risks.

Unclear risk profile. The exposure of workers, consumers and the environment to novel nanomaterials may involve hazards unknown with conventional chemical substances.

Regulatory and liability risks. The current level of uncertainty in risk assessment may cause fatal regulatory and liability risks in the value chain.

NanoRisk Check is a new tool that will give you an overview of your company's risk position regarding the handling and use of nanomaterials in products.

NanoRisk Check targets companies in R&D, production, manufacturing and retailing and includes a nano-specific

- assessment of the **suitability of the current risk management system**
- on-site analysis of **occupational health and safety** in production (HSE risks)
- analysis of the current situation regarding **product and liability risks**

NanoRisk Check is conducted as a block by renowned nanotechnology experts from TÜV SÜD Industry Service (Munich) and the Innovation Society (St.Gallen) e.g.:

- Day 1: Factory tour with operating managers
- Day 2: Analysis and processing of findings
- Day 3 (half day): Presentation of results

We provide you with an overview of potential weaknesses in best time. In addition, *NanoRisk Check* is the first step towards implementing further solutions.
